Internet & SaaS (ZIA)

About SSL/TLS Inspection Policy

Watch a video about SSL/TLS Inspection Policy (shows legacy UI).

SSL/TLS Inspection policies are used to perform scanning of the SSL/TLS traffic based on the source and destination of the traffic.

The SSL/TLS Inspection policies provide the following benefits and enable you to:

- Simplify the deployment and ongoing operations of SSL/TLS Inspection.
- Address the compliance and operational environment requirements.
- Inspect traffic for malware and data loss.
- Allow, block, or restrict tenants.

Predefined Special Rules

Zscaler provides the following predefined special rules which you can enable or disable based on your requirements.

These rules are not editable and can only be implemented as is.

- **Zscaler-Recommended Exemptions rule**: Predefined rule to automatically exempt known destinations that cannot be SSL/TLS inspected. This rule is enabled by default.

  - The Zscaler-recommended exemptions URL category contains a few dozen destinations that cannot be SSL/TLS inspected for various reasons, such as certificate pinning. This list also includes Zscaler-owned domains.
  - To discover the traffic that is not getting SSL/TLS inspected due to this rule, you can search the weblogs using the SSL/TLS Policy Reason field for the reason *Not inspected because of Zscaler best practices*. The percentage of traffic that matches this rule is commonly very small and less than 1%.
  - While it is recommended not to inspect these domains, you can always disable the rule with the Edit option. Alternatively, you can leave the rule enabled, but create higher order inspect rules if you want to inspect only specific domains outside the list.

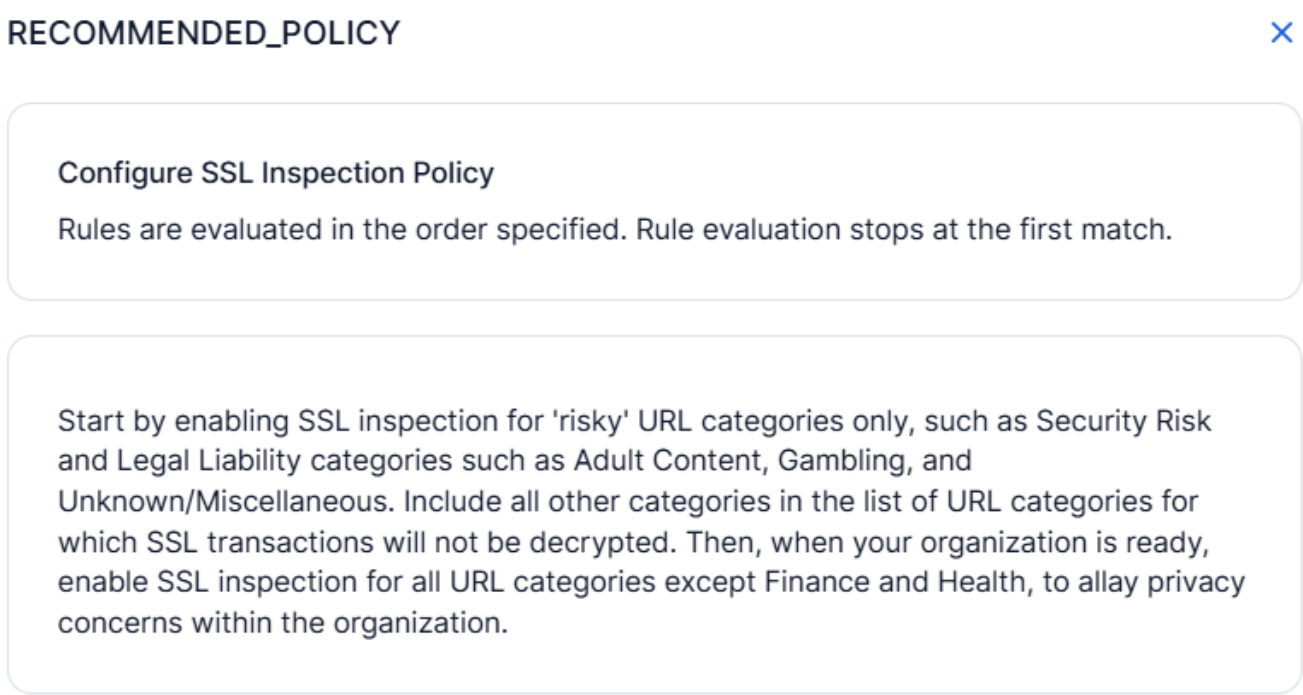
- **O365 tenant restriction inspection rules**: Predefined rules to enable Office 365 Tenancy Restrictions for location and remote user traffic.
- **O365 One Click rule**: Predefined rule, controlled by the Microsoft-Recommended and Legacy Office 365 One Click setting.
- **UCaaS One Click rule**: Predefined rule, controlled by the UCaaS One Click configuration.
- **Unauthorized Traffic Bypass for IoT Classifications rule**: Predefined rule to allow unauthorized traffic bypass SSL/TLS Inspection for IoT classifications in all IoT policy-enabled locations. This rule is disabled by default and cannot be deleted. You can modify the Rule Order, Admin Rank, Rule Status, Rule Label, and choose Evaluate Other Policies or Bypass Other Policies under Do Not Inspect Action for this rule and cannot edit other attributes. You can enable this rule to temporarily allow unauthorized traffic to bypass SSL/TLS Inspection, so that Zscaler AI/ML can classify devices.

About the SSL/TLS Inspection Policy Page

On the SSL/TLS Inspection Policy page (Policy > Common Configuration > SSL/TLS Inspection > SSL/TLS Inspection Policy), you can do the following:

1. View the recommended SSL/TLS Inspection policy.



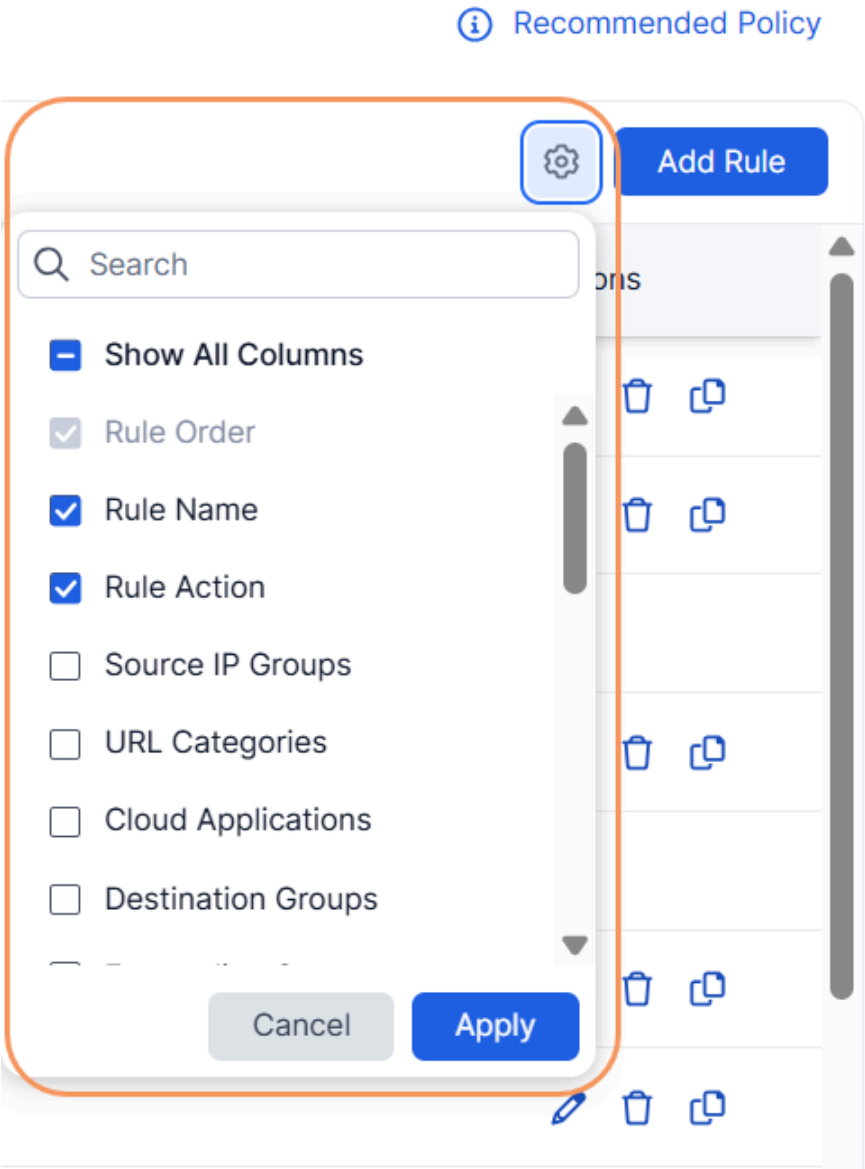
©2026 Zscaler, Inc. All rights reserved.

2. Search for an SSL/TLS Inspection rule.
3. Select the following column options to view the SSL/TLS Inspection rules accordingly:

   List of columns

   - Rule Name
   - Rule Action
   - Source IP Groups
   - URL Categories
   - Cloud Applications
   - Destination Groups
   - Forwarding Gateways
   - ZPA Application Segment
   - Locations
   - Location Groups
   - Users
   - Groups
   - Departments
   - Devices
   - Device Groups
   - Workload Groups
   - Remote Users with Kerberos
   - Device Trust Level
   - CONNECT User-Agent
   - Labels
   - Description

©2026 Zscaler, Inc. All rights reserved.



4. Add an SSL/TLS Inspection rule.
5. View a list of all SSL/TLS Inspection rules. For each SSL/TLS Inspection rule, you can view:
    - **Rule Order**: The order of the rule.
    - **Rule Name**: The name of the rule.
    - **Rule Action**: The action configured for the rule.
    - **Labels**: The label of the policy rule, if available.
    - **Description**: The description of the policy rule, if available.
6. Arrange the **Rule Order** or **Rule Name** column in ascending or descending order.
